# SOLO WEBSITE PROJECT

Noah Taylor

It was a dark and stormy night, I started the Solo Website Project. It was no simple task, but not too challenging either.

Just right. “Perfect temperature” as some may say.

What troubles you may be asking?

The troubles of having too many conflicting CSS files.

That was my main issue with this project. I really didn’t have many other issues besides trying a bunch of different things to align text to the center of a page. I came up with a workaround however, instead of using one layout page connecting all of the different websites together. I copied the CSS from the main page and created a basic layout for not only the CSS file, but the HTML file as well. I was trying to have 2 CSS files connected to two different HTML files, therefore messing everything up

Such as;

#### **FILE1**

1. `<meta charset="utf-8" />`
2. `<link href="style.css" rel="stylesheet"/>`
3. `<link href="other.css" rel="stylesheet"/>`

#### **FILE2 (Figure 1-2)**

1. `<meta charset="utf-8" />`
2. `<link href="style.css" rel="stylesheet" />`
3. `<link href="notOther.css" rel="stylesheet"/>`

Having the two conflicting “style.css” on both **Figure 1-1, and Figure 1-2, in line 2** caused a lot of mess for me and for whatever reason my brain didn’t want to click that it was the issue at first. Not only causing me a lot of grief but a lot of time to spend on re-making a new individual CSS file for each section of my webpage.

Here was my time spent on each part in total:

**HTML5:** 3 HOURS (From Project Start Date – December 6<sup>th</sup>)

**CSS:** 2.5 HOURS (From Project Start Date – December 6<sup>th</sup>)

**GATHERING IMAGES/UPLOADING WORK:** INCLUDED IN THE TIME OF HTML

**OTHER:** Sleeping (From Project Start Date – December 6<sup>th</sup>) TOO LONG
